

LIS302DL

MEMS motion sensor 3-axis - $\pm 2g/\pm 8g$ smart digital output “piccolo” accelerometer

Preliminary Data

Feature

- 2.16V to 3.6V supply voltage
- 1.8V compatible IOs
- <1mW power consumption
- $\pm 2g/\pm 8g$ dynamically selectable Full-Scale
- I²C/SPI digital output interface
- Programmable multiple interrupt generator
- Embedded high pass filter
- Embedded self test
- 10000g high shock survivability
- ECOPACK® RoHS and “Green” compliant (see [Section 8](#))

Description

The LIS302DL is an ultra compact low-power three axes linear accelerometer. It includes a sensing element and an IC interface able to provide the measured acceleration to the external world through I²C/SPI serial interface.

The sensing element, capable of detecting the acceleration, is manufactured using a dedicated process developed by ST to produce inertial sensors and actuators in silicon.

The IC interface is manufactured using a CMOS process that allows to design a dedicated circuit which is trimmed to better match the sensing element characteristics.

The LIS302DL has dynamically user selectable full scales of $\pm 2g/\pm 8g$ and it is capable of measuring accelerations with an output data rate of 100Hz or 400Hz.

Order codes

Part number	Temp range, °C	Package	Packing
LIS302DL	-40 to +85	LGA	Tray
LIS302DLTR	-40 to +85	LGA	Tape and reel

A self-test capability allows the user to check the functioning of the sensor in the final application.

The device may be configured to generate inertial wake-up/free-fall interrupt signals when a programmable acceleration threshold is crossed at least in one of the three axes. Thresholds and timing of interrupt generators are completely programmable by the end user on the fly.

The LIS302DL is available in plastic Thin Land Grid Array package (TLGA) and it is guaranteed to operate over an extended temperature range from -40°C to +85°C.

The LIS302DL belongs to a family of products suitable for a variety of applications:

- Free-Fall detection
- Motion activated functions
- Gaming and Virtual Reality input devices
- Vibration Monitoring and Compensation

2 Mechanical and electrical specifications

2.1 Mechanical characteristics

Table 2. Mechanical Characteristics⁽¹⁾

(All the parameters are specified @ Vdd=2.5V, T = 25°C unless otherwise noted)

Symbol	Parameter	Test conditions	Min.	Typ. ⁽²⁾	Max.	Unit
FS	Measurement range ⁽³⁾	FS bit set to 0	±2.0	±2.3		g
		FS bit set to 1	±8.0	±9.2		
So	Sensitivity	FS bit set to 0	16.2	18	19.8	mg/digit
		FS bit set to 1	64.8	72	79.2	
TCSO	Sensitivity Change Vs Temperature	FS bit set to 0		±0.01		%/°C
TyOff	Typical Zero-g Level Offset Accuracy ^{(4),(5)}	FS bit set to 0		±40		mg
		FS bit set to 1		±60		mg
TCOff	Zero-g Level Change Vs Temperature	Max delta from 25°C		±0.5		mg/°C
Vst	Self Test Output Change ^{(6),(7),(8)}	FS bit set to 0 STP bit used X axis Vdd=2.16V to 3.6V	-16		-3	LSb
		FS bit set to 0 STP bit used Y axis Vdd=2.16V to 3.6V	3		16	LSb
		FS bit set to 0 STP bit used Z axis Vdd=2.16V to 3.6V	3		16	LSb
BW	System Bandwidth ⁽⁹⁾			ODR/2		Hz
Top	Operating Temperature Range		-40		+85	°C
Wh	Product Weight			30		mgram

1. The product is factory calibrated at 2.5V. The device can be used from 2.16V to 3.6V

2. Typical specification are not guaranteed

3. Verified by wafer level test and measurement of initial offset and sensitivity

4. Typical zero-g level offset value after MSL3 preconditioning

5. Offset can be eliminated by enabling the built-in high pass filter

6. If STM bit is used values change in sign for all axes

7. Self Test output changes with the power supply. Self test "output change" is defined as $\text{OUTPUT}[\text{LSb}]_{(\text{Self-test bit on ctrl_reg1}=1)} - \text{OUTPUT}[\text{LSb}]_{(\text{Self-test bit on ctrl_reg1}=0)}$. 1LSb=4.6g/256 at 8bit representation, ±2.3g Full-Scale

8. Output data reach 99% of final value after 3/ODR when enabling Self-Test mode due to device filtering

9. ODR is output data rate. Refer to table 3 for specifications

2.2 Electrical characteristics

Table 3. Electrical Characteristics⁽¹⁾

(All the parameters are specified @ Vdd=2.5V, T= 25°C unless otherwise noted)

Symbol	Parameter	Test conditions	Min.	Typ. ⁽²⁾	Max.	Unit
Vdd	Supply voltage		2.16	2.5	3.6	V
Vdd_IO	I/O pins Supply voltage ⁽³⁾		1.71		Vdd+0.1	V
Idd	Supply current	T = 25°C, ODR=100Hz		0.3	0.4	mA
IddPdn	Current consumption in power-down mode	T = 25°C		1	5	μA
VIH	Digital High level Input voltage		0.8*Vdd_IO			V
VIL	Digital Low level Input voltage				0.2*Vdd_IO	V
VOH	High level Output Voltage		0.9*Vdd_IO			V
VOL	Low level Output Voltage				0.1*Vdd_IO	V
ODR	Output Data Rate	DR=0		100		Hz
		DR=1		400		
BW	System Bandwidth ⁽⁴⁾			ODR/2		Hz
Ton	Turn-on Time ⁽⁵⁾			3/ODR		s
Top	Operating Temperature Range		-40		+85	°C

1. The product is factory calibrated at 2.5V. The device can be used from 2.16V to 3.6V
2. Typical specification are not guaranteed
3. It is possible to remove Vdd maintaining Vdd_IO without blocking the communication busses, in this condition the measurement chain is powered off.
4. Filter cut-off frequency
5. Time to obtain valid data after exiting Power-Down mode

2.3 Absolute maximum ratings

Stresses above those listed as “absolute maximum ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device under these conditions is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability.

Table 4. Absolute maximum ratings

Symbol	Ratings	Maximum Value	Unit
V _{dd}	Supply voltage	-0.3 to 6	V
V _{dd_IO}	I/O pins Supply voltage	-0.3 to 6	V
V _{in}	Input voltage on any control pin (CS, SCL/SPC, SDA/SDI/SDO)	-0.3 to V _{dd_IO} +0.3	V
A _{POW}	Acceleration (Any axis, Powered, V _{dd} =2.5V)	3000g for 0.5 ms	
		10000g for 0.1 ms	
A _{UNP}	Acceleration (Any axis, Unpowered)	3000g for 0.5 ms	
		10000g for 0.1 ms	
T _{OP}	Operating Temperature Range	-40 to +85	°C
T _{STG}	Storage Temperature Range	-40 to +125	°C
ESD	Electrostatic discharge protection	0 - 2 (HBM)	kV

Note: Supply voltage on any pin should never exceed 6.0V

This is a Mechanical Shock sensitive device, improper handling can cause permanent damages to the part

This is an ESD sensitive device, improper handling can cause permanent damages to the part

2.4 Terminology

2.4.1 Sensitivity

Sensitivity describes the gain of the sensor and can be determined e.g. by applying 1g acceleration to it. As the sensor can measure DC accelerations this can be done easily by pointing the axis of interest towards the center of the earth, noting the output value, rotating the sensor by 180 degrees (point to the sky) and noting the output value again. By doing so, $\pm 1g$ acceleration is applied to the sensor. Subtracting the larger output value from the smaller one and dividing the result by 2 leads to the actual sensitivity of the sensor. This value changes very little over temperature and also very little over time. The Sensitivity Tolerance describes the range of Sensitivities of a large population of sensor.

2.4.2 Zero-g level

Zero-g level Offset (Off) describes the deviation of an actual output signal from the ideal output signal if there is no acceleration present. A sensor in a steady state on a horizontal surface will measure 0g in X axis and 0g in Y axis whereas the Z axis will measure 1g. The output is ideally in the middle of the dynamic range of the sensor (content of OUT registers 00h, data expressed as 2's complement number). A deviation from ideal value in this case is called Zero-g offset. Offset is to some extent a result of stress to a precise MEMS sensor and therefore the offset can slightly change after mounting the sensor onto a printed circuit board or exposing it to extensive mechanical stress. Offset changes little over temperature, see "Zero-g level change vs. temperature". The Zero-g level of an individual sensor is stable over lifetime. The Zero-g level tolerance describes the range of Zero-g levels of a population of sensors.

2.4.3 Self Test

Self Test allows to check the sensor functionality without moving it. The Self Test function is off when the self-test bit of ctrl_reg1 (control register 1) is programmed to '0'. When the self-test bit of ctrl_reg1 is programmed to '1' an actuation force is applied to the sensor, simulating a definite input acceleration. In this case the sensor outputs will exhibit a change in their DC levels which is related to the selected full scale through the device sensitivity. When Self Test is activated, the device output level is given by the algebraic sum of the signals produced by the acceleration acting on the sensor and by the electrostatic test-force. If the output signals change within the amplitude specified inside Table 2, then the sensor is working properly and the parameters of the interface chip are within the defined specification.

3 Functionality

The LIS302DL is a ultracompact, low-power, digital output 3-axis linear accelerometer packaged in a LGA package. The complete device includes a sensing element and an IC interface able to take the information from the sensing element and to provide a signal to the external world through an I²C/SPI serial interface.

3.1 Sensing element

A proprietary process is used to create a surface micro-machined accelerometer. The technology allows to carry out suspended silicon structures which are attached to the substrate in a few points called anchors and are free to move in the direction of the sensed acceleration. To be compatible with the traditional packaging techniques a cap is placed on top of the sensing element to avoid blocking the moving parts during the moulding phase of the plastic encapsulation.

When an acceleration is applied to the sensor the proof mass displaces from its nominal position, causing an imbalance in the capacitive half-bridge. This imbalance is measured using charge integration in response to a voltage pulse applied to the sense capacitor.

At steady state the nominal value of the capacitors are few pF and when an acceleration is applied the maximum variation of the capacitive load is in fF range.

3.2 IC interface

The complete measurement chain is composed by a low-noise capacitive amplifier which converts into an analog voltage the capacitive unbalancing of the MEMS sensor and by analog-to-digital converters.

The acceleration data may be accessed through an I²C/SPI interface thus making the device particularly suitable for direct interfacing with a microcontroller.

The LIS302DL features a Data-Ready signal (RDY) which indicates when a new set of measured acceleration data is available thus simplifying data synchronization in digital system employing the device itself.

The LIS302DL may also be configured to generate an inertial Wake-Up and Free-Fall interrupt signal accordingly to a programmed acceleration event along the enabled axes. Both Free-Fall and Wake-Up can be available simultaneously on two different pins.

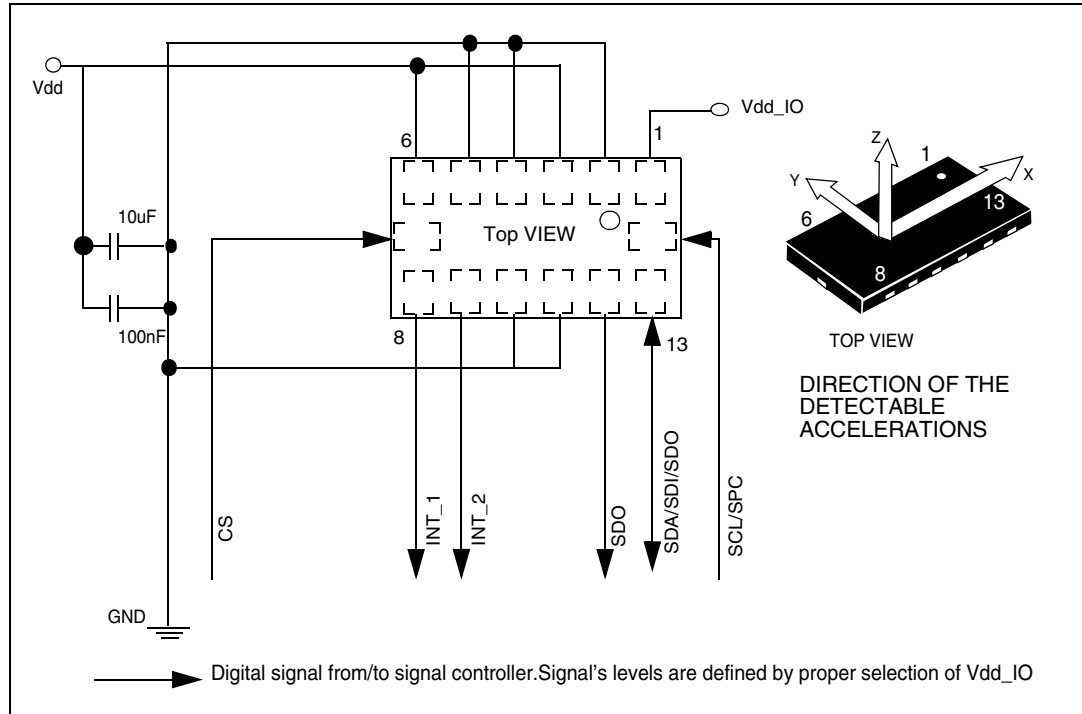

3.3 Factory calibration

The IC interface is factory calibrated for sensitivity (So) and Zero-g level (Off).

The trimming values are stored inside the device by a non volatile structure. Any time the device is turned on, the trimming parameters are downloaded into the registers to be employed during the normal operation. This allows the user to employ the device without further calibration.

4 Application hints

Figure 3. LIS302DL electrical connection

The device core is supplied through Vdd line while the I/O pads are supplied through Vdd_IO line. Power supply decoupling capacitors (100 nF ceramic, 10 μF Al) should be placed as near as possible to the pin 6 of the device (common design practice).

All the voltage and ground supplies must be present at the same time to have proper behavior of the IC (refer to Fig. 3). It is possible to remove Vdd maintaining Vdd_IO without blocking the communication busses, in this condition the measurement chain is powered off.

The functionality of the device and the measured acceleration data is selectable and accessible through the I²C/SPI interface. When using the I²C, CS must be tied high while SDO must be left floating.

The functions, the threshold and the timing of the two interrupt pins (INT 1 and INT 2) can be completely programmed by the user through the I²C/SPI interface.

4.1 Soldering information

The LGA package is compliant with the ECOPACK, RoHS and “green” standard. It is qualified for soldering heat resistance according to JEDEC J-STD-020C. Pin #1 indicator is electrically connected to pin 1. Leave pin 1 indicator unconnected during soldering. Land pattern and soldering recommendation are available at www.st.com/mems.

5 Digital Interfaces

The registers embedded inside the LIS302DL may be accessed through both the I²C and SPI serial interfaces. The latter may be SW configured to operate either in 3-wire or 4-wire interface mode.

The serial interfaces are mapped onto the same pads. To select/exploit the I²C interface, CS line must be tied high (i.e connected to Vdd_IO).

Table 5. Serial interface pin description

PIN Name	PIN Description
CS	SPI enable I ² C/SPI mode selection (1: I ² C mode; 0: SPI enabled)
SCL/SPC	I ² C Serial Clock (SCL) SPI Serial Port Clock (SPC)
SDA/SDI/SDO	I ² C Serial Data (SDA) SPI Serial Data Input (SDI) 3-wire Interface Serial Data Output (SDO)
SDO	SPI Serial Data Output (SDO)

5.1 I²C Serial Interface

The LIS302DL I²C is a bus slave. The I²C is employed to write the data into the registers whose content can also be read back.

The relevant I²C terminology is given in the table below.

Table 6. Serial interface pin description

Term	Description
Transmitter	The device which sends data to the bus
Receiver	The device which receives data from the bus
Master	The device which initiates a transfer, generates clock signals and terminates a transfer
Slave	The device addressed by the master

There are two signals associated with the I²C bus: the Serial Clock Line (SCL) and the Serial Data line (SDA). The latter is a bidirectional line used for sending and receiving the data to/from the interface. Both the lines are connected to Vdd_IO through a pull-up resistor embedded inside the LIS302DL. When the bus is free both the lines are high.

The I²C interface is compliant with Fast Mode (400 kHz) I²C standards as well as the Normal Mode.

5.1.1 I²C operation

The transaction on the bus is started through a START (ST) signal. A START condition is defined as a HIGH to LOW transition on the data line while the SCL line is held HIGH. After this has been transmitted by the Master, the bus is considered busy. The next byte of data transmitted after the start condition contains the address of the slave in the first 7 bits and the eighth bit tells whether the Master is receiving data from the slave or transmitting data to the slave. When an address is sent, each device in the system compares the first seven bits after a start condition with its address. If they match, the device considers itself addressed by the Master.

The Slave Address (SAD) associated to the LIS302DL is 001110xb. **SDO** pad can be used to modify less significant bit of the device address. If SDO pad is connected to voltage supply LSb is '1' (address 0011101b) else if SDO pad is connected to ground LSb value is '0' (address 0011100b). This solution permits to connect and address two different accelerometer to the same I²C lines.

Data transfer with acknowledge is mandatory. The transmitter must release the SDA line during the acknowledge pulse. The receiver must then pull the data line LOW so that it remains stable low during the HIGH period of the acknowledge clock pulse. A receiver which has been addressed is obliged to generate an acknowledge after each byte of data has been received.

The I²C embedded inside the LIS302DL behaves like a slave device and the following protocol must be adhered to. After the start condition (ST) a slave address is sent, once a slave acknowledge (SAK) has been returned, a 8-bit sub-address will be transmitted: the 7 LSb represent the actual register address while the MSB enables address auto increment. If the MSb of the SUB field is 1, the SUB (register address) will be automatically incremented to allow multiple data read/write.

The slave address is completed with a Read/Write bit. If the bit was '1' (Read), a repeated START (SR) condition will have to be issued after the two sub-address bytes; if the bit is '0' (Write) the Master will transmit to the slave with direction unchanged.

Transfer when Master is writing one byte to slave

Master	ST	SAD + W		SUB		DATA		SP
Slave			SAK		SAK		SAK	

Transfer when Master is writing multiple bytes to slave:

Master	ST	SAD + W		SUB		DATA		DATA		SP
Slave			SAK		SAK		SAK		SAK	

Transfer when Master is receiving (reading) one byte of data from slave:

Master	ST	SAD + W		SUB		SR	SAD + R			NMAK	SP
Slave			SAK		SAK			SAK	DATA		

Transfer when Master is receiving (reading) multiple bytes of data from slave

Master	ST	SAD + W		SUB		SR	SAD + R			MAK
Slave			SAK		SAK			SAK	DATA	

Master		MAK		NMAK	SP
Slave	DATA		DATA		

Data are transmitted in byte format (DATA). Each data transfer contains 8 bits. The number of bytes transferred per transfer is unlimited. Data is transferred with the Most Significant bit (MSb) first. If a receiver can't receive another complete byte of data until it has performed some other function, it can hold the clock line, SCL LOW to force the transmitter into a wait state. Data transfer only continues when the receiver is ready for another byte and releases the data line. If a slave receiver doesn't acknowledge the slave address (i.e. it is not able to receive because it is performing some real time function) the data line must be left HIGH by the slave. The Master can then abort the transfer. A LOW to HIGH transition on the SDA line while the SCL line is HIGH is defined as a STOP condition. Each data transfer must be terminated by the generation of a STOP (SP) condition.

In order to read multiple bytes, it is necessary to assert the most significant bit of the sub-address field. In other words, SUB(7) must be equal to 1 while SUB(6-0) represents the address of first register to read.

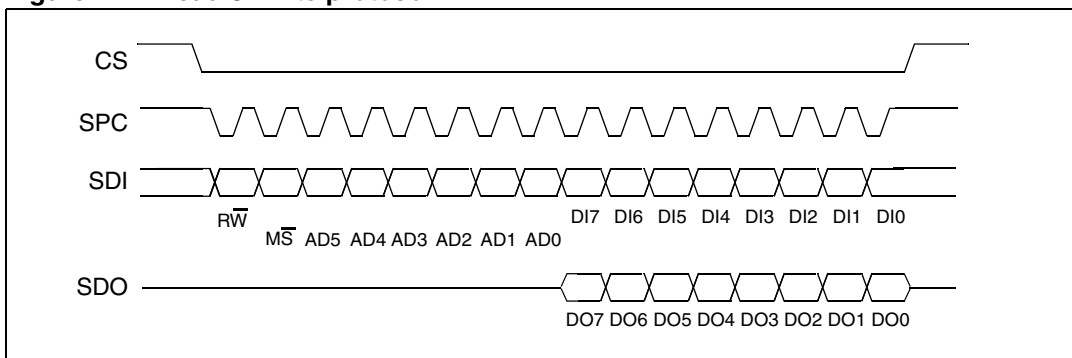

In the presented communication format MAK is Master Acknowledge and NMAK is No Master Acknowledge.

5.2 SPI bus interface

The LIS302DL SPI is a bus slave. The SPI allows to write and read the registers of the device.

The Serial Interface interacts with the outside world with 4 wires: **CS**, **SPC**, **SDI** and **SDO**.

Figure 4. Read & write protocol

CS is the Serial Port Enable and it is controlled by the SPI master. It goes low at the start of the transmission and goes back high at the end. **SPC** is the Serial Port Clock and it is controlled by the SPI master. It is stopped high when **CS** is high (no transmission). **SDI** and **SDO** are respectively the Serial Port Data Input and Output. Those lines are driven at the falling edge of **SPC** and should be captured at the rising edge of **SPC**.

Both the Read Register and Write Register commands are completed in 16 clock pulses or in multiple of 8 in case of multiple byte read/write. Bit duration is the time between two falling edges of **SPC**. The first bit (bit 0) starts at the first falling edge of **SPC** after the falling edge of **CS** while the last bit (bit 15, bit 23, ...) starts at the last falling edge of **SPC** just before the rising edge of **CS**.

bit 0: \overline{RW} bit. When 0, the data $DI(7:0)$ is written into the device. When 1, the data $DO(7:0)$ from the device is read. In latter case, the chip will drive **SDO** at the start of bit 8.

bit 1: \overline{MS} bit. When 0, the address will remain unchanged in multiple read/write commands. When 1, the address will be auto incremented in multiple read/write commands.

bit 2-7: address $AD(5:0)$. This is the address field of the indexed register.

bit 8-15: data $DI(7:0)$ (write mode). This is the data that will be written into the device (MSb first).

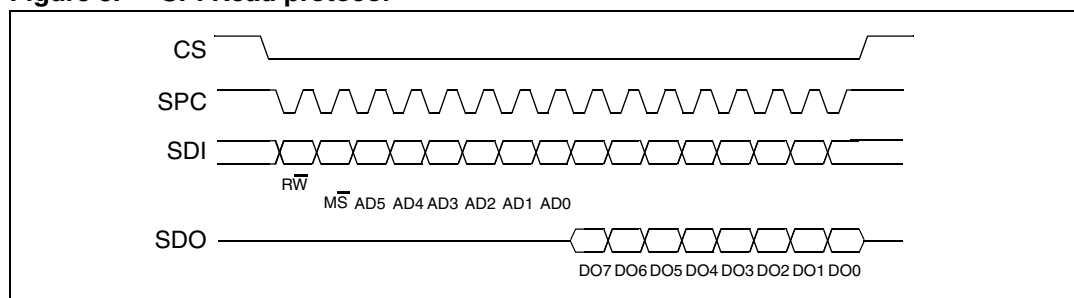

bit 8-15: data $DO(7:0)$ (read mode). This is the data that will be read from the device (MSb first).

In multiple read/write commands further blocks of 8 clock periods will be added. When \overline{MS} bit is 0 the address used to read/write data remains the same for every block. When \overline{MS} bit is 1 the address used to read/write data is incremented at every block.

The function and the behavior of **SDI** and **SDO** remain unchanged.

5.2.1 SPI Read

Figure 5. SPI Read protocol

The SPI Read command is performed with 16 clock pulses. Multiple byte read command is performed adding blocks of 8 clock pulses at the previous one.

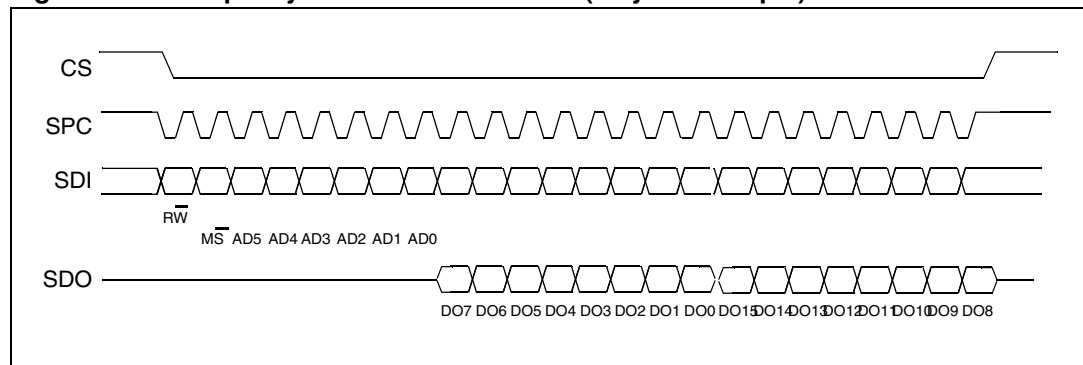

bit 0: READ bit. The value is 1.

bit 1: \overline{MS} bit. When 0 do not increment address, when 1 increment address in multiple reading.

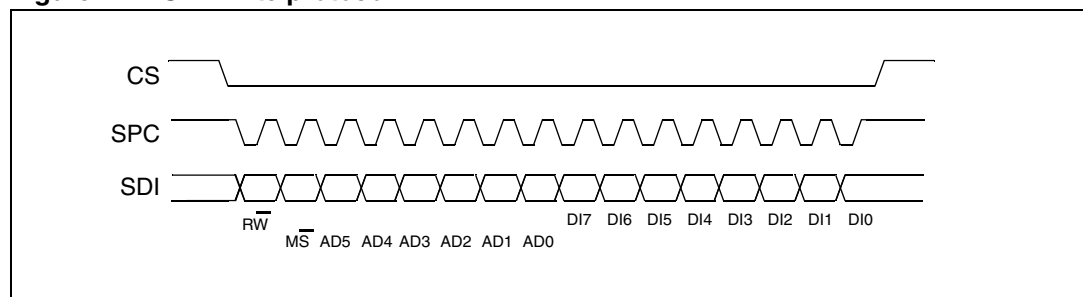

bit 2-7: address $AD(5:0)$. This is the address field of the indexed register.

bit 8-15: data $DO(7:0)$ (read mode). This is the data that will be read from the device (MSb first).

bit 16-... : data $DO(...-8)$. Further data in multiple byte reading.

Figure 6. Multiple bytes SPI Read Protocol (2 bytes example)

5.2.2 SPI Write

Figure 7. SPI Write protocol

The SPI Write command is performed with 16 clock pulses. Multiple byte write command is performed adding blocks of 8 clock pulses at the previous one.

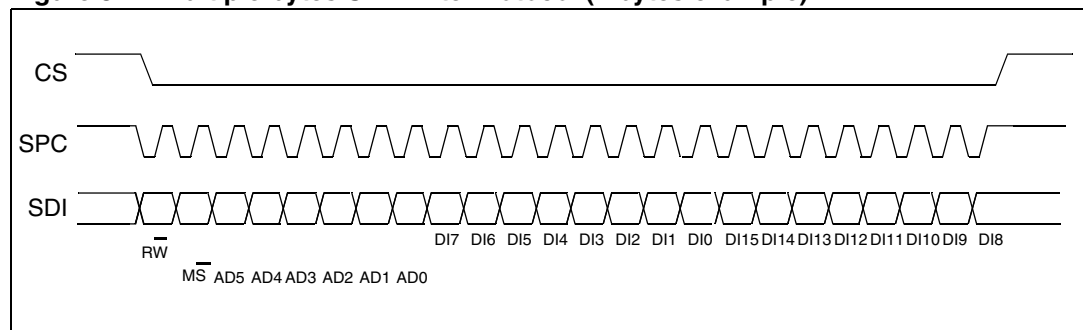

bit 0: WRITE bit. The value is 0.

bit 1: \overline{MS} bit. When 0 do not increment address, when 1 increment address in multiple writing.

bit 2 -7: address AD[5:0]. This is the address field of the indexed register.

bit 8-15: data DI[7:0] (write mode). This is the data that will be written inside the device (MSb first).

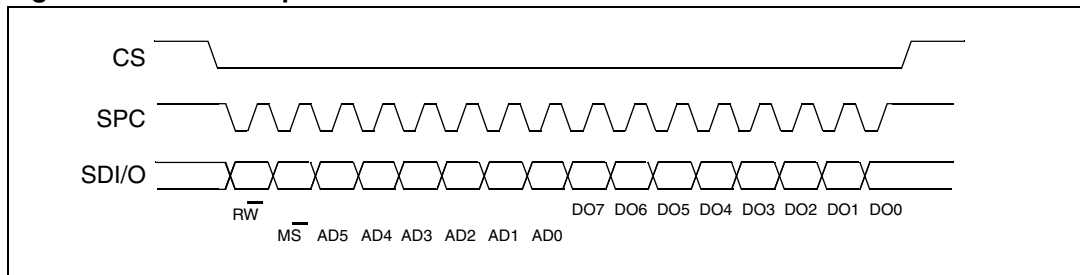

bit 16-... : data DI[...-8]. Further data in multiple byte writing.

Figure 8. Multiple bytes SPI Write Protocol (2 bytes example)

5.2.3 SPI Read in 3-wires mode

3-wires mode is entered by setting to 1 bit SIM (SPI Serial Interface Mode selection) in CTRL_REG2.

Figure 9. SPI Read protocol in 3-wires mode

The SPI Read command is performed with 16 clock pulses:

bit 0: READ bit. The value is 1.

bit 1: \overline{MS} bit. When 0 do not increment address, when 1 increment address in multiple reading.

bit 2-7: address AD(5:0). This is the address field of the indexed register.

bit 8-15: data DO(7:0) (read mode). This is the data that will be read from the device (MSb first).

Multiple read command is also available in 3-wires mode.

6 Register mapping

The table given below provides a listing of the 8 bit registers embedded in the device and the related address:

Table 7. Register address map

Name	Type	Register Address		Default	Comment
		0Hex	0Binary		
Reserved (Do not modify)		00-0E			Reserved
Who_Am_I	r	0F	000 1111	00111011	Dummy register
Reserved (Do not modify)		10-1F			Reserved
Ctrl_Reg1	rw	20	010 0000	00000111	
Ctrl_Reg2	rw	21	010 0001	00000000	
Ctrl_Reg3	rw	22	010 0010	00000000	
HP_filter_reset	r	23	010 0011	dummy	Dummy register
Reserved (Do not modify)		24-26			Reserved
Status_Reg	r	27	010 0111	00000000	
--	r	28	010 1000		Not Used

FF_WU_CFG_1	rw	30	011 0000	00000000	
FF_WU_SRC_1(ack1)	r	31	011 0001	00000000	
FF_WU_THS_1	rw	32	011 0010	00000000	
FF_WU_DURATION_1	rw	33	011 0011	00000000	
FF_WU_CFG_2	rw	34	011 0100	00000000	
FF_WU_SRC_2 (ack2)	r	35	011 0101	00000000	
FF_WU_THS_2	rw	36	011 0110	00000000	
FF_WU_DURATION_2	rw	37	011 0111	00000000	
Reserved (Do not modify)	rw	38-3F			Reserved

Registers marked as reserved must not be changed. The writing to those registers may cause permanent damages to the device.

The content of the registers that are loaded at boot should not be changed. They contain the factory calibration values. Their content is automatically restored when the device is powered-up.

7 Register description

The device contains a set of registers which are used to control its behavior and to retrieve acceleration data. The registers address, made of 7 bits, is used to identify them and to write the data through serial interface.

7.1 WHO_AM_I (0Fh)

0	0	1	1	1	0	1	1
---	---	---	---	---	---	---	---

Device identification register.

This register contains the device identifier that for LIS302DL is set to 3Bh.

7.2 CTRL_REG1 (20h)

DR	PD	FS	STP	STM	Zen	Yen	Xen
----	----	----	-----	-----	-----	-----	-----

DR	Data rate selection. Default value: 0 (0: 100 Hz output data rate; 1: 400 Hz output data rate)
PD	Power Down Control. Default value: 0 (0: power down mode; 1: active mode)
FS	Full Scale selection. Default value: 0 (refer to table 2 for typical full scale value)
STP, STM	Self Test Enable. Default value: 0 (0: normal mode; 1: self test P, M enabled)
Zen	Z axis enable. Default value: 1 (0: Z axis disabled; 1: Z axis enabled)
Yen	Y axis enable. Default value: 1 (0: Y axis disabled; 1: Y axis enabled)
Xen	X axis enable. Default value: 1 (0: X axis disabled; 1: X axis enabled)

DR bit allows to select the data rate at which acceleration samples are produced. The default value is 0 which corresponds to a data-rate of 100Hz. By changing the content of DR to “1” the selected data-rate will be set equal to 400Hz.

PD bit allows to turn on the turn the device out of power-down mode. The device is in power-down mode when PD= “0” (default value after boot). The device is in normal mode when PD is set to 1.

STP, STM bit is used to activate the self test function. When the bit is set to one, an output change will occur to the device outputs (refer to table 2 and 3 for specification) thus allowing to check the functionality of the whole measurement chain.

Zen bit enables the generation of DataReady signal for Z-axis measurement channel when set to 1. The default value is 1.

Yen bit enables the generation of DataReady signal for Y-axis measurement channel when set to 1. The default value is 1.

Xen bit enables the generation of DataReady signal for X-axis measurement channel when set to 1. The default value is 1.

7.3 CTRL_REG2 (21h)

SIM	BOOT	--	FDS	HP_FF_W U2	HP_FF_W U1	HP_coe_ff 2	HP_coe_ff 1
-----	------	----	-----	---------------	---------------	----------------	----------------

SIM	SPI Serial Interface Mode selection. Default value: 0 (0: 4-wire interface; 1: 3-wire interface)
BOOT	Reboot memory content. Default value: 0 (0: normal mode; 1: reboot memory content)
FDS	Filtered Data Selection. Default value: 0 (0: internal filter bypassed; 1: data from internal filter sent to output register)
HP FF_WU2	High Pass filter enabled for FreeFall/WakeUp # 2. Default value: 0 (0: filter bypassed; 1: filter enabled)
HP FF_WU1	High Pass filter enabled for Free-Fall/Wake-Up #1. Default value: 0 (0: filter bypassed; 1: filter enabled)
HP coeff2 HP coeff1	High pass filter cut-off frequency configuration. Default value: 00 (See table below)

SIM bit selects the SPI Serial Interface Mode. When SIM is '0' (default value) the 4-wire interface mode is selected. The data coming from the device are sent to SDO pad. In 3-wire interface mode output data are sent to SDA_SDI pad.

BOOT bit is used to refresh the content of internal registers stored in the flash memory block. At the device power up the content of the flash memory block is transferred to the internal registers related to trimming functions to permit a good behavior of the device itself. If for any reason the content of trimming registers was changed it is sufficient to use this bit to restore correct values. When BOOT bit is set to '1' the content of internal flash is copied inside corresponding internal registers and it is used to calibrate the device. These values are factory trimmed and they are different for every accelerometer. They permit a good behavior of the device and normally they have not to be changed. At the end of the boot process the BOOT bit is set again to '0'.

FDS bit enables (FDS=1) or bypass (FDS=0) the high pass filter in the signal chain of the sensor

HP_coeff[2:1]. These bits are used to configure high-pass filter cut-off frequency ft.

HPcoeff2,1	ft (Hz) (DR=100 Hz)	ft (Hz) (DR=400 Hz)
00	2	8
01	1	4
10	0.5	2
11	0.25	1

7.4 CTRL_REG3 [Interrupt CTRL register] (22h)

IHL	PP_OD	I2CFG2	I2CFG1	I2CFG0	I1CFG2	I1CFG1	I1CFG0
-----	-------	--------	--------	--------	--------	--------	--------

IHL	Interrupt active high, low. Default value 0. (0: active high; 1: active low)
PP_OD	Push-pull/Open Drain selection on interrupt pad. Default value 0. (0: push-pull; 1: open drain)
I2CFG2 I2CFG1 I2CFG0	Data Signal on Int2 pad control bits. Default value 000. (see table below)
I1CFG2 I1CFG1 I1CFG0	Data Signal on Int1 pad control bits. Default value 000. (see table below)

I1(2)_CFG2	I1(2)_CFG1	I1(2)_CFG0	Int1(2) Pad
0	0	0	GND
0	0	1	FF_WU_1
0	1	0	FF_WU_2
0	1	1	FF_WU_1 or FF_WU_2
1	0	0	Datready
1	1	1	Not Used

7.5 HP_FILTER_RESET (23h)

Dummy register. Reading at this address zeroes instantaneously the content of the internal high pass-filter. Read data is not significant.

7.6 STATUS_REG (27h)

ZXYOR	ZOR	YOR	XOR	ZYXDA	ZDA	YDA	XDA
ZYXOR	X, Y and Z axis Data Overrun. Default value: 0 (0: no overrun has occurred; 1: new data has over written the previous one before it was read)						
ZOR	Z axis Data Overrun. Default value: 0 (0: no overrun has occurred; 1: a new data for the Z-axis has overwritten the previous one)						
YOR	Y axis Data Overrun. Default value: 0 (0: no overrun has occurred; 1: a new data for the Y-axis has overwritten the previous one)						
XOR	X axis Data Overrun. Default value: 0 (0: no overrun has occurred; 1: a new data for the X-axis has overwritten the previous one)						
ZYXDA	X, Y and Z axis new Data Available. Default value: 0 (0: a new set of data is not yet available; 1: a new set of data is available)						
ZDA	Z axis new Data Available. Default value: 0 (0: a new data for the Z-axis is not yet available; 1: a new data for the Z-axis is available)						
YDA	Y axis new Data Available. Default value: 0 (0: a new data for the Y-axis is not yet available; 1: a new data for the Y-axis is available)						
XDA	X axis new Data Available. Default value: 0 (0: a new data for the X-axis is not yet available; 1: a new data for the X-axis is available)						

7.7 OUT_X (29h)

XD7	XD6	XD5	XD4	XD3	XD2	XD1	XD0
-----	-----	-----	-----	-----	-----	-----	-----

X axis output data.

7.8 OUT_Y (2Bh)

YD7	YD6	YD5	YD4	YD3	YD2	YD1	YD0
-----	-----	-----	-----	-----	-----	-----	-----

Y axis output data.

7.9 OUT_Z (2Dh)

ZD7	ZD6	ZD5	ZD4	ZD3	ZD2	ZD1	ZD0
-----	-----	-----	-----	-----	-----	-----	-----

Z axis output data.

7.10 FF_WU_CFG_1 (30h)

AOI	LIR	ZHIE	ZLIE	YHIE	YLIE	XHIE	XLIE
AOI	And/Or combination of Interrupt events. Default value: 0 (0: OR combination of interrupt events; 1: AND combination of interrupt events)						
LIR	Latch Interrupt request into FF_WU_SRC reg with the FF_WU_SRC reg cleared by reading FF_WU_SRC_1 reg. Default value: 0 (0: interrupt request not latched; 1: interrupt request latched)						
ZHIE	Enable interrupt generation on Z high event. Default value: 0 (0: disable interrupt request; 1: enable interrupt request on measured accel. value higher than preset threshold)						
ZLIE	Enable interrupt generation on Z low event. Default value: 0 (0: disable interrupt request; 1: enable interrupt request on measured accel. value lower than preset threshold)						
YHIE	Enable interrupt generation on Y high event. Default value: 0 (0: disable interrupt request; 1: enable interrupt request on measured accel. value higher than preset threshold)						
YLIE	Enable interrupt generation on Y low event. Default value: 0 (0: disable interrupt request; 1: enable interrupt request on measured accel. value lower than preset threshold)						
XHIE	Enable interrupt generation on X high event. Default value: 0 (0: disable interrupt request; 1: enable interrupt request on measured accel. value higher than preset threshold)						
XLIE	Enable interrupt generation on X low event. Default value: 0 (0: disable interrupt request; 1: enable interrupt request on measured accel. value lower than preset threshold)						

7.11 FF_WU_SRC_1 (31h)

X	IA	ZH	ZL	YH	YL	XH	XL
IA	Interrupt Active. Default value: 0 (0: no interrupt has been generated; 1: one ore more interrupt has been generated)						
ZH	Z High. Default value: 0 (0: no interrupt, 1: ZH event has occurred)						
ZL	Z Low. Default value: 0 (0: no interrupt; 1: ZL event has occurred)						
YH	Y High. Default value: 0 (0: no interrupt, 1: YH event has occurred)						
YL	Y Low. Default value: 0 (0: no interrupt, 1: YL event has occurred)						
XH	X High. Default value: 0 (0: no interrupt, 1: XH event has occurred)						
XL	X Low. Default value: 0 (0: no interrupt, 1: XL event has occurred)						

Free-fall and wake-up source register. Read only register.

Reading at this address clears FF_WU_SRC_1 register and the FF, WU 1 interrupt and allows the refreshment of data in the FF_WU_SRC_1 register if the latched option was chosen.

7.12 FF_WU_THS_1 (32h)

DCRM	THS6	THS5	THS4	THS3	THS2	THS1	THS0
DCRM	Resetting mode selection. Default value: 0 (0: counter resetted; 1: counter decremented)						
THS6, THS0	Free-fall / wake-up Threshold: default value: 000 0000						

Most significant bit (DCRM) is used to select the resetting mode of the duration counter. If DCRM=0 counter is resetted when the interrupt is no more active else if DCRM=1 duration counter is decremented.

7.13 FF_WU_DURATION_1 (33h)

D7	D6	D5	D4	D3	D2	D1	D0
D7-D0		Duration value. Default value: 0000 0000					

Duration register for Free-Fall/Wake-Up interrupt 1. Duration step and maximum value depend on the ODR chosen. Step 2.5 msec, from 0 to 637.5 msec if ODR=400Hz, else step 10 msec, from 0 to 2.55 sec when ODR=100Hz. The counter used to implement duration function is blocked when LIR=1 in configuration register and the interrupt event is verified

7.14 FF_WU_CFG_2 (34h)

AOI	LIR	ZHIE	ZLIE	YHIE	YLIE	XHIE	XLIE
AOI	And/Or combination of Interrupt events. Default value: 0 (0: OR combination of interrupt events; 1: AND combination of interrupt events)						
LIR	Latch Interrupt request into FF_WU_SRC reg with the FF_WU_SRC reg cleared by reading FF_WU_SRC_2 reg. Default value: 0 (0: interrupt request not latched; 1: interrupt request latched)						
ZHIE	Enable interrupt generation on Z high event. Default value: 0 (0: disable interrupt request; 1: enable interrupt request on measured accel. value higher than preset threshold)						
ZLIE	Enable interrupt generation on Z low event. Default value: 0 (0: disable interrupt request; 1: enable interrupt request on measured accel. value lower than preset threshold)						
YHIE	Enable interrupt generation on Y high event. Default value: 0 (0: disable interrupt request; 1: enable interrupt request on measured accel. value higher than preset threshold)						
YLIE	Enable interrupt generation on Y low event. Default value: 0 (0: disable interrupt request; 1: enable interrupt request on measured accel. value lower than preset threshold)						
XHIE	Enable interrupt generation on X high event. Default value: 0 (0: disable interrupt request; 1: enable interrupt request on measured accel. value higher than preset threshold)						
XLIE	Enable interrupt generation on X low event. Default value: 0 (0: disable interrupt request; 1: enable interrupt request on measured accel. value lower than preset threshold)						

7.15 FF_WU_SRC_2 (35h)

X	IA	ZH	ZL	YH	YL	XH	XL
IA	Interrupt Active. Default value: 0 (0: no interrupt has been generated; 1: one or more interrupt event has been generated)						
ZH	Z High. Default value: 0 (0: no interrupt; 1: ZH event has occurred)						
ZL	Z Low. Default value: 0 (0: no interrupt; 1: ZL event has occurred)						
YH	Y High. Default value: 0 (0: no interrupt; 1: YH event has occurred)						
YL	Y Low. Default value: 0 (0: no interrupt; 1: YL event has occurred)						
XH	X High. Default value: 0 (0: no interrupt; 1: XH event has occurred)						
XL	X Low. Default value: 0 (0: no interrupt; 1: XL event has occurred)						

Free-fall and wake-up source register. Read only register.

Reading at this address clears FF_WU_SRC_2 register and the FF, WU 2 interrupt and allows the refreshment of data in the FF_WU_SRC_2 register if the latched option was chosen.

7.16 FF_WU_THS_2 (36h)

DCRM	THS6	THS5	THS4	THS3	THS2	THS1	THS0
DCRM	Resetting mode selection. Default value: 0 (0: counter resetted; 1: counter decremented)						
THS6, THS0	Free-fall / wake-up Threshold. Default value: 000 0000						

Most significant bit (DCRM) is used to select the resetting mode of the duration counter. If DCRM=0 counter is resetted when the interrupt is no more active else if DCRM=1 duration counter is decremented.

7.17 FF_WU_DURATION_2 (37h)

D7	D6	D5	D4	D3	D2	D1	D0
D7-D0	Duration value. Default value: 0000 0000						

Duration register for Free-Fall/Wake-Up interrupt 2. Duration step and maximum value depend on the ODR chosen. Step 2.5 msec, from 0 to 637.5 msec if ODR=400Hz, else step 10 msec, from 0 to 2.55 sec when ODR=100Hz. The counter used to implement duration function is blocked when LIR=1 in configuration register and the interrupt event is verified.

8 Package information

In order to meet environmental requirements, ST offers these devices in ECOPACK® packages. These packages have a Lead-free second level interconnect. The category of second Level Interconnect is marked on the package and on the inner box label, in compliance with JEDEC Standard JESD97. The maximum ratings related to soldering conditions are also marked on the inner box label. ECOPACK is an ST trademark.

ECOPACK specifications are available at: www.st.com.
